**22AIE212    Design and Analysis of Algorithms**  
**Lab Sheet 2**

**Iterative programs-Part 2**

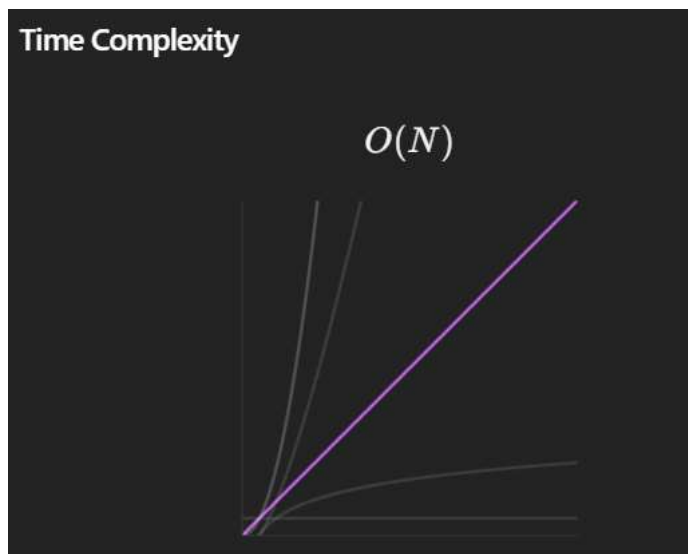

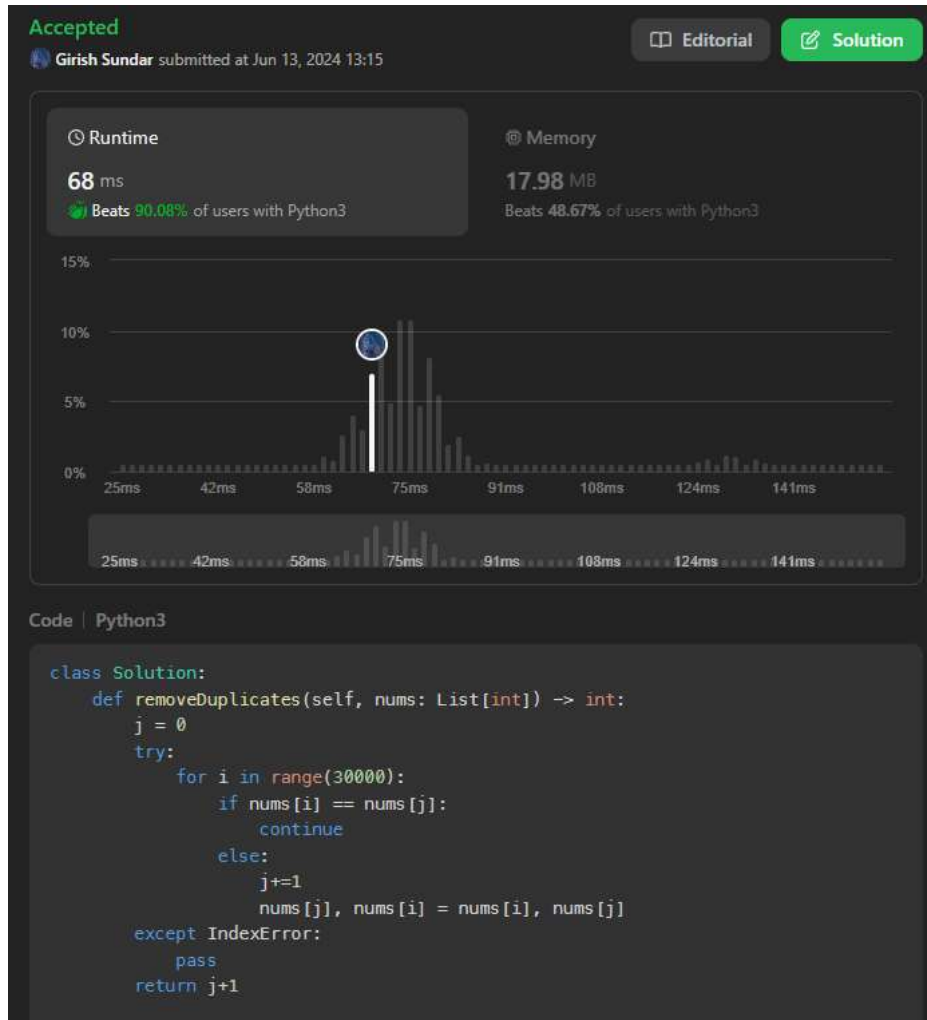

1. You are given a sorted array A of size n. Write an iterative program to remove the duplicates from the array. For example, if  $A[] = \{2, 7, 7, 11, 24, 24, 24, 29, 36, 36\}$ , your output should be  $B[] = \{2, 7, 11, 24, 29, 36\}$ .
  - a. Count the operations to get the closed-form equation of running time (worst case).
  - b. Submit the program for the problem <https://leetcode.com/problems/remove-duplicates-from-sorted-array/> and submit the snapshot of acceptance as proof.
  - c. What is the time complexity?

```
A = [2, 7, 7, 11, 24, 24, 29, 36, 36]
```

```
def removeduplicates(arr):  
    return list(set(arr))
```

```
def removeduplicates2(arr):  
    B = []  
    for i in arr:  
        if i not in B:  
            B.append(i)  
    return B  
removeduplicates2(A)
```

```
→ [2, 7, 11, 24, 29, 36]
```

2. Consider an array  $A$  of size  $n$ . Split  $A[]$  into the two arrays  $Low[]$  and  $High[]$  such that  $Low[]$  contains all elements  $< A[0]$  and  $High[]$  contains all elements  $\geq A[0]$ .
  - a. Write an iterative algorithm and implement it.
  - b. What is the time complexity?

$A = [5, 4, 2, 8, 7, 1, 3, 9, 0, 6]$

```
def splitArr(A):
```

```

L, R = [], []
pivot = A[0]
for i in A:
    if i < pivot:
        L.append(i)
    else:
        R.append(i)
return L, R

```

```
splitArr(A)
```

```
→ ([4, 2, 1, 3, 0], [5, 8, 7, 9, 6])
```

**Time Complexity:  $O(N)$**

3. Given two sorted lists  $A[1..n]$  and  $B[1..n]$ , write an algorithm to merge them into a single sorted list  $C[1..2n]$ . For example, if  $A[] = \{1,3,6,7\}$  and  $B[] = \{2,4,5,8\}$ , then  $C[] = \{1,2,3,4,5,6,7,8\}$ .
- Find the complexity
  - Submit the program for the problem <https://leetcode.com/problems/merge-two-sorted-lists/> and submit the snapshot of acceptance as proof

```

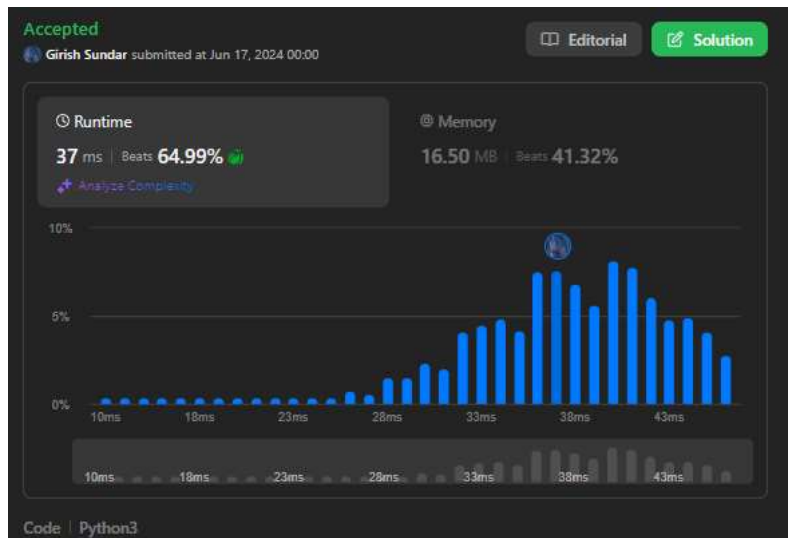

A = [1, 3, 6, 7]
B = [2, 4, 5, 8]

```

```
sorted(A+B)
```

```
→ [1, 2, 3, 4, 5, 6, 7, 8]
```

4. There is a class with  $m$  students and  $n$  exams. You are given a 0-indexed  $m \times n$  integer matrix called `score`, where `score[i][j]` denotes the score the  $i$ th student got in the  $j$ th exam. The matrix `score` contains distinct integers only. You are also given an integer  $k$ . Sort the students (i.e., the rows of the matrix) by their scores in the  $k$ th (0-indexed) exam from the highest to the lowest. Return the matrix after sorting it.
- Find the time complexity
  - Submit the program for the problem <https://leetcode.com/problems/sort-the-students-by-their-kth-score/description/> and submit the snapshot of acceptance as proof.

```
score = [[10,6,9,1],[7,5,11,2],[4,8,3,15]]
k = 2
sorted(score, key=lambda row:row[k], reverse=True)

→ [[7, 5, 11, 2], [10, 6, 9, 1], [4, 8, 3, 15]]
```

$O(N \log N)$
